

# 光伏2.0公共配置文件和软件私有配置文件读取接口说明

此接口只包括如下的两个配置文件:

公共配置文件为GetPvPubFile( PV\_PUBCFG\_FILE )返回的ini配置文件

私有配置文件为GetPvRunPar( RUNPAR\_CFGFILE )返回的ini配置文件

此接口用到了如下两个开源代码:

minIni 一个可移植迷你ini文件解析器 (大约900行源码)

jsoncpp json工具库

配合文件监视器接口可实现不用重启程序,配置文件的值动态实时生效

## 使用方法举例

### 1.项目代码新引入源文件或库文件说明

- 引入Json的静态库文件libjson\_linux-gcc-4.8.5\_libmt.a(此库文件是通过开源代码jsoncpp-src-0.5.0编译而成,不同的编译环境名称略有不同)

- 将Json的头文件夹 json 引入到项目（注意此处并不把json文件夹下的文件直接引入项目，因此程序中在包括头文件是加了json文件夹的路径的）
- 引入minIni的源码文件 minIni.h、minGlue.h、minIni.c
- 引入PvDir的源码文件 PvDir.h、PvDir.cpp 或 库文件libPvDir.a和PvDir.h
- 引入PvCfg的源码文件 PvCfg.h、PvCfg.cpp

## 2.在项目中调用接口的顺序及接口使用说明

### (1) 加载配置文件

```
/* *****  
 * brief : 程序开始时调用此接口加载公共配置和软件私有配置文件  
 * note : 在主程序开始时就调用  
***** */  
  
int PvCfgInitialize();
```

### (2) 在需要配置值处调用接口取配置值

- 取公共配置的值

```
/* *****  
 * brief : 获取公共配置"/xxx/pvfs20/id1/pubfile/pub_config.init"的值  
 * par :  
 *      val      从配置文件取得的配置值  
 *      section  需要取值的域名
```

```

*          key          需要取值的key名
*   ret  :
*
*       0   成功
*      !0   失败
*   note  :
*
*       如果配置文件中存在没有域名的配置值,section也要输入,此时section
*       的值为"ROOT"
*
*****/
int GetPvPubCfgVal( std::string &val, const char* section, const char* key );

```

- 取私有配置的值

```

/*****
*   brief  : 获取软件私有配置"程序运行路径/程序名小写_config.init"的值
*   par  :
*
*       val      从配置文件取得的配置值
*       section  需要取值的域名
*       key      需要取值的key名
*   ret  :
*
*       0   成功
*      !0   失败
*   note  :
*
*       如果配置文件中存在没有域名的配置值,section也要输入,此时section
*       的值为"ROOT"
*
*****/
int GetPvSftCfgVal( std::string &val, const char* section, const char* key );

```

### (3) 如果需要解析接口返回值的字符含义

```
/* *****  
 * brief : 返回PvCfg接口返回值的字符描述  
 * note : err_val为其他接口的返回值  
***** */  
const char* PvCfgErrMsg( int ret);
```

## 3.在项目中实现配置文件值动态更新方法

需要参考文件监视器接口说明:

- 1.在文件监视器里添加对公共配置文件和私有配置文件的监视;
- 2.在文件接收处理程序的处理逻辑里调用重新加载配置文件接口

配置文件重新加载接口如下:

```
/* *****  
 * brief : 重新加载公共配置文件的配置  
 * note : 在公共配置文件有修改时调用  
***** */  
int PvReloadPubCfg();
```

```
/**
 * brief : 重新加载软件私有配置文件的配置
 * note : 在私有配置文件有修改时调用
 */
int PvReloadSftCfg();
```

## 附: 样例代码
